

**SYSTEM FOR COLLECTION, MANIPULATION, AND ANALYSIS OF DATA  
FROM REMOTE HEALTH CARE DEVICES**

**Abstract**

5           A system for determining whether a person should have professional health care  
attention, and providing clinical notes to the caregiver, may include the following. The  
system includes a monitoring device having a microprocessor operably coupled to a  
memory unit. The microprocessor is operably coupled to an input device, an output  
device, and a communication device. The memory unit is programmed with a set of  
10 instructions for posing questions to the person via the output device, receiving answers  
from the person via the input device, and transmitting the answers to a remote computer  
via the communication device. The remote computer is programmed to determine  
whether the person should be seen by a health care professional, based at least in part  
upon the answers entered into the input device. Further, the remote computer is  
15 programmed to generate a clinical note based upon the answers transmitted to the  
remote computer.
